Osteoporotic fractures

in Greenland?

Vertebral fractures in Greenland

Vibeke N Sørensen, Piotr Voitjek, Dorte Jørgensen, Stig Andersen
Arctic Health Research Centre, Aalborg University Hospital, Denmark
Dept. of Internal Medicine, Dept. of Radiology, Queen Ingrid's Hospital, Nuuk, Greenland

Background

- Lack of sun and 66% smokers in Greenland influence the risk of osteoporotic fractures.
- BMD is similar in Inuit and Caucasians.
- Evaluation of vertebral fractures among Inuit is lacking.
- Vertebral fractures may be diagnosed from lateral chest radiographs.
- Chest radiographs are frequently done and readily available.

Aims

- To determine the occurrence of vertebral fractures among patients admitted to Queen Ingrid's Hospital in Nuuk, Greenland, compared to an outpatient population, and

- to estimate the need for osteoporosis treatment.

Methods

Evaluation of all lateral chest radiographs performed at Queen Ingrid's Hospital in Nuuk, Greenland, over a three month period.

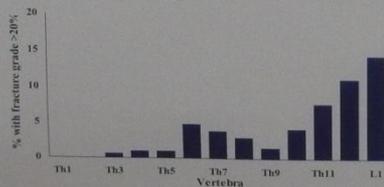

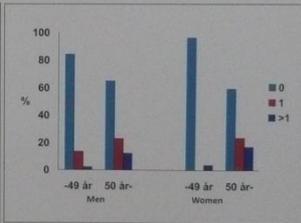

Fractures were assessed by measurement of vertebral body heights at the anterior, middle and posterior regions.

Results

Table 1
Descriptives of consecutive chest radiographs performed over a three month period at Queen Ingrid's Hospital in Nuuk, Greenland.

	All n (%)	Men n (%)	Women n (%)	P*
Number of radiographs	293	118 (58.1)	85 (41.9)	0.002
vertebrae evaluated	1869	1047 (56.0)	822 (44.0)	
Age				0.19
30-49 years	70 (34.8)	44 (37.3)	26 (30.6)	
50-69 years	105 (51.7)	61 (51.7)	44 (51.8)	
70-89 years	26 (13.8)	13 (11.0)	15 (17.6)	
Referring Department				0.64
General Medicine	65 (32.0)	38 (32.2)	27 (31.7)	
Internal Medicine	94 (46.3)	59 (50.0)	35 (41.2)	
Surgery	44 (21.7)	21 (17.8)	23 (27.1)	

* Chi-squared test
* More vertebrae eligible for evaluation in women than in men (Average, women 9.7 vs men 8.9)

Logistic regression	B	OR	95% CI
Gender	0.96	0.98	(0.8-1.0)
Age	0.000	0.21	(0.1-0.4)
Referring Department	0.33	0.66	(0.3-1.5)

Conclusions

Vertebral deformities were commonly detected on lateral chest radiographs in this population.

The occurrence increased with age.

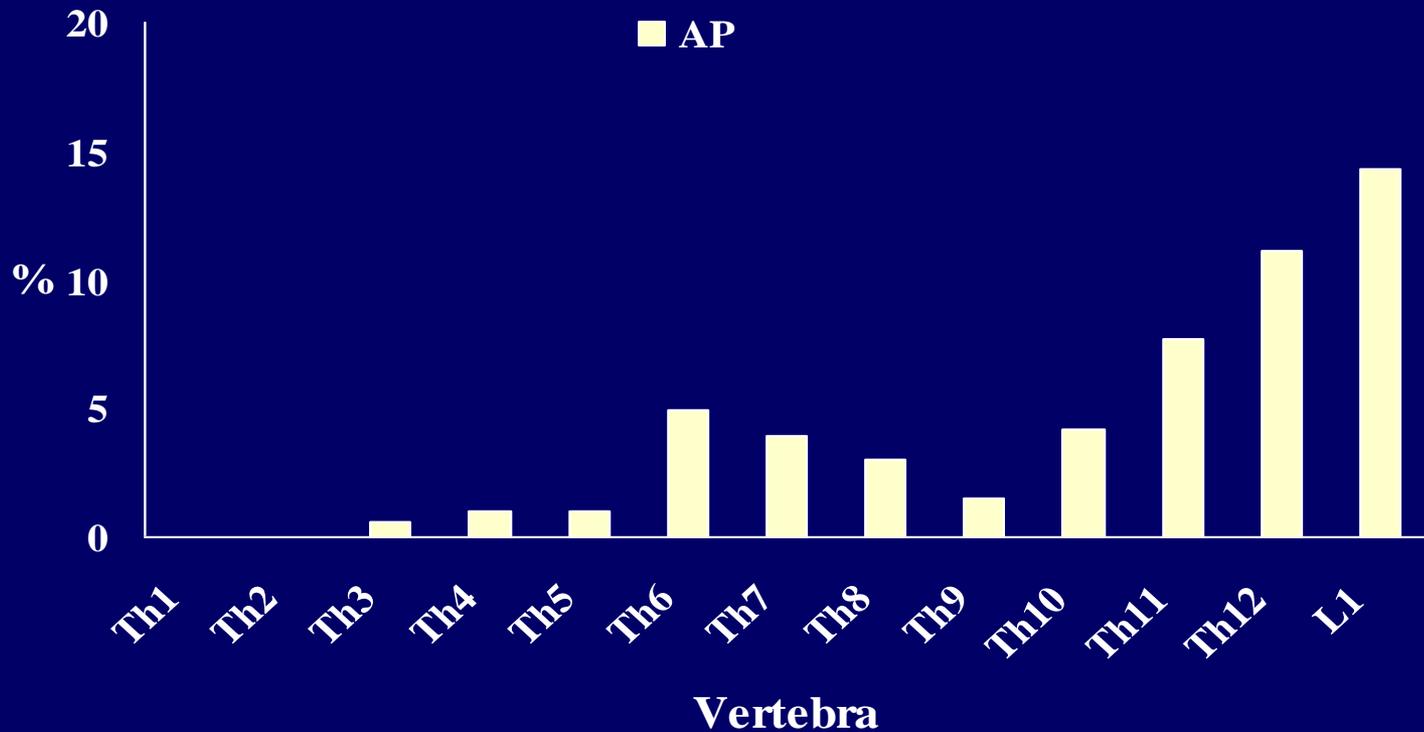

They were detected in about one third of men and half of old women aged 70 years and above.

A mere 0.2% of the population in the capital Nuuk received treatment for osteoporosis.

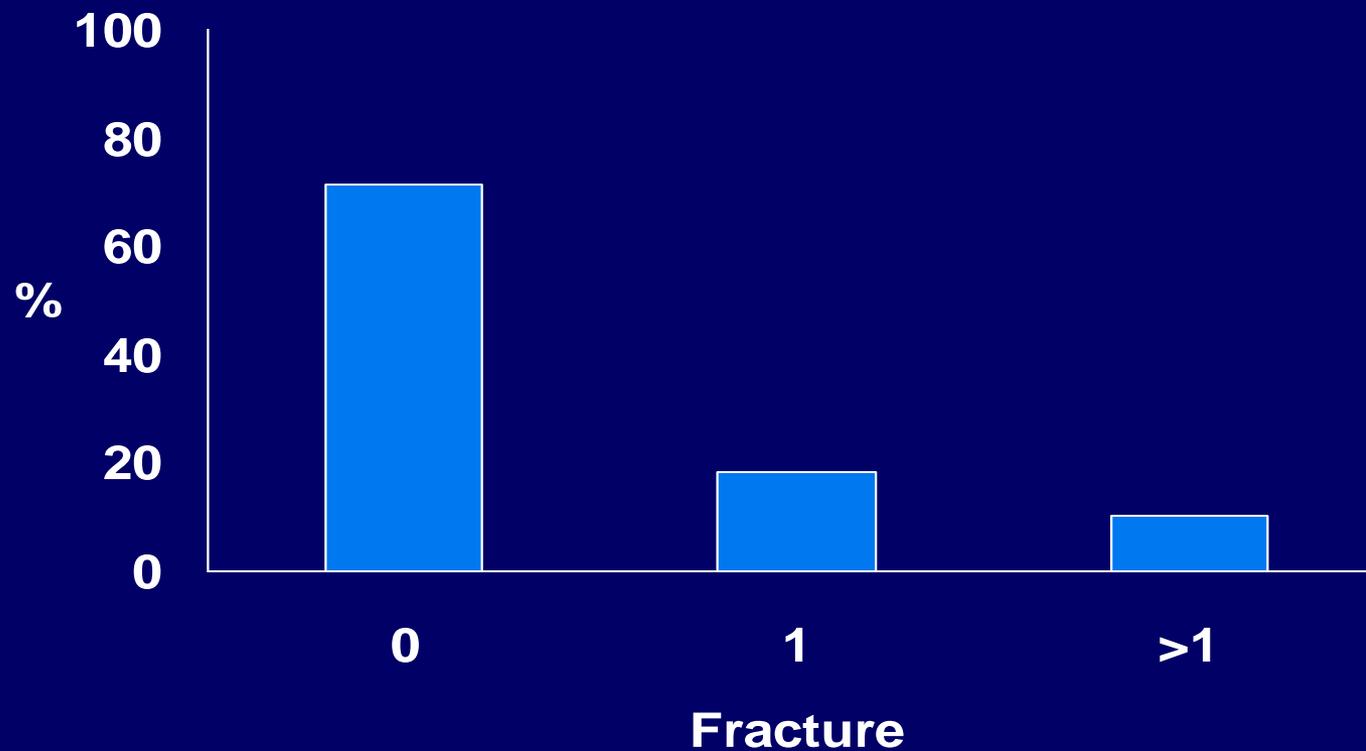

All lateral chest x-rays
over 3 months:

- 5.607 measures
- 1.869 vertebrae
- 203 x-rays

Vertebral deformity >25%

Vertebral deformity >25%

Body proportions and Arctic habitat

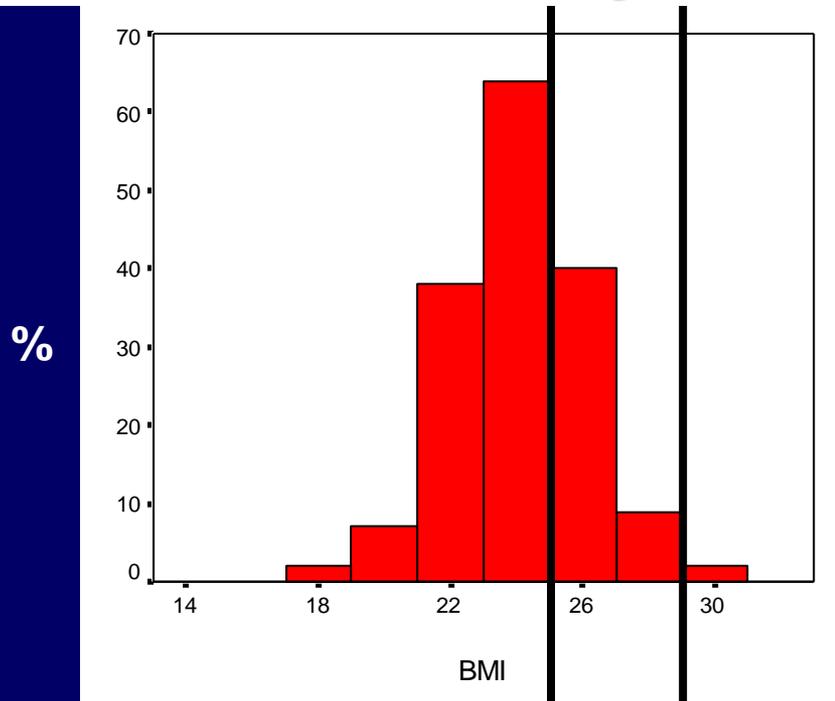

- Cold

- decreases growth of the limbs
